Urea plasminogen activator residues 177-184.

AAR74920;

13-MAY-1996 (first entry)

AAR74920 standard; Peptide; 8 AA

_

Tissue plasminogen activator (t-PA) analogue - has increased fibrin specificity and can be used as an antithrombotic agent. t-PA; tissue plasminogen activator; urea plasminogen activator; UK; variant; fibrin specificity; haemorrhagic tendency. WPI; 1995-155249/20. 01-OCT-1993; 29-JUL-1994; 30-SEP-1994; W09509908-A1 Homo sapiens. 13-APR-1995. Negoro T, (SUMU) SUMITOMO SEIYAKU KK. Sato H; 93JP-0269983. 94JP-0197635. 94WO-JP01629

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The peptides AAR72872-3 covering the amino acids (AA) 159-188 or 177-188 of urokinase (UK) were used to replace AA 276-306 of tissue plasminogen activator (t-PA)(AAR72874). The modified t-PA also has several N-bound sugar chain and additional consensus sequences replaced with urokinase sequences. The replacement was engineered by PCR using the primers AAQ86925-6 to replace the sequences encoding the AA 276-306 in the t-PA cDNA sequence. The modified t-PA may be used in the treatment of thrombosis and has an improved half-life in the blood.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tissue plasminogen activator (t-PA) mutant comprising sequences of urinary plasminogen activator - has improved half life in the blood and may be used to treat thrombosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The urinary plasminogen activator (UK) residues 163-186 are used in a tissue plasminogen activator (t-PA) variant to replace t-PA residues 280-304. The UK replacement region at least contains the sequence of AAR74917. t-PA variants, having residues 280-304 substituted with the corresponding residues from UK, have improved fibrin specificity and are useful in treatment of thrombosis by reducing adverse reactions of
                                                              Tissue plasminogen activator analog improved in fibrin specificity - obtd. by replacing part of aminoacid sequence with corresponding aminoacid sequence of urinary plasminogen activator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           u-PA (159-188)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 1;

                                                                                                     Analogues of tissue plasminogen activator (t-PA) have amino acids from position 280-304 replaced by the corresponding sequence of urea plasminogen activator (UK). The UK replacement region at least contains the sequence of ARR74917. CS18 comprises a tPA variant (residues 276-306) where residues 294-304 have been replaced by the corresponding UK sequence. The t-PA variants have improved fibrin specificity and are useful in treatment of thrombosis by reducing adverse reactions of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            T-PA analogue has at least part of natural t-PA (276-306) substd. with corresp. amino acid sequence of u-PA (159-188). The analogue hardly causes activation of plasminogen (and hence decomposition of fibrinogen), while in circulation (blood). It activates plasminogen to cause thrombolyis when it reaches the locus of the thrombus where fibrin is present. It has high fibrin, and therefore thrombus specificity and is not expected to cause general bleeding as side effect. It also is resistant to plasminogen activation factor inhibiting factor 1. Therefore, the analogue will
                                                                                                                                                                                                                                                                Tissue plasminogen activator (t-PA) analogue - has increased fibrin specificity and can be used as an antithrombotic agent.
                                                                                                                                                                                                                                                                                                                                                                                                                      01-OCT-1993;

                                                                                                                                                                                                                                                                                                                                                                Analogues of tissue plasminogen activator (t-PA) have amino acids from position 280-304 replaced by the corresponding sequence of urea plasminogen activator (UK). The UK replacement region at least contains the sequence of AAR74917. CS18 comprises a tPA variant (residues 276-306) where residues 294-302 have been replaced by the corresponding UK sequence. The t-PA variants have improved fibrin specificity and are useful in treatment of thrombosis by reducing adverse reactions of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Tissue plasminogen activator (t-PA) analogue - has increased fibrin specificity and can be used as an antithrombotic agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (SOMO)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Analogues of tissue plasminogen activator (t-PA) have amino acids from position 280-304 replaced by the corresponding sequence of urea position activator (UK). The UK replacement region at least contains the sequence of AAR74917. CS15 comprises a tPA variant (residues the sequence of AAR74917. CS15 comprises a tPA variant (residues 276-306) where residues 290-302 have been replaced by the corresponding UK sequence. The t-PA variants have improved fibrin specificity and are useful in treatment of thrombosis by reducing adverse reactions of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tissue plasminogen activator (t-PA) analogue - has increased specificity and can be used as an antithrombotic agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WO9509908-A1

The modified t-PA also has several N-bound sugar chain and additional consensus sequences replaced with urokinase sequences. The replacement was engineered by PCR using the primers AAQ86925-6 to replace the sequences encoding the AA 276-306 in the t-PA cDNA sequence. The modified t-PA may be used in the treatment of thrombosis and has an improved half-life in the blood.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tissue plasminogen activator (t-PA) mutant comprising sequences of urinary plasminogen activator - has improved half life in the blood and may be used to treat thrombosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 1; Page 2; 13pp; Japanese.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 1995-151486/20.
Sequence
                           t-PAs can be used bleeding.
                                         AAR79104 is the wild type plasminogen activator (t-PA), residues 276-306. By replacing these residues with the urint plasminogen activator (UK) sequences described in AAR71662-R71666, the fibrinogen specificity of t-PA is increased. The modified t-PAs can be used in the treatment of thrombosis and low systemic

The tpA analogue has resistance to inhibition by plasminogen activator inhibitor (PAI) while retaining its tpA activity. The analogue can be used in a drug for the treatment of thrombosis.
         t-PA; tissue plasminogen activator; urinary plasminogen
variant; fibrin specificity; haemorrhagic tendency.

                              Novel t-PA variant containing urinary plasminogen activator residues - has improved fibrin specificity to reduce adverse reaction of haemorrhagic tendency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The urinary plasminogen activator (UK) residues 150-188 are used in a tissue plasminogen activator (t-PA) variant to replace t-PA residues 266-306. t-PA variants, having residues 276-306 substituted with the corresponding residues from UK, have improved fibrin specificity. They are useful in reducing adverse reactions of haemorrhagic tendency. Residues 266-275 and/or 307-321 are opt. substd..

FUNCTION: PLAYS AN IMPORTANT ROLE IN THE INITIATION AND REGULATION
OF CHROMOSOMAL REPLICATION. BINDS TO THE ORIGIN OF REPLICATION;
IT BINDS SPECIFICALLY DOUBLE-STRANDED DNA AT A 9 BP CONSENSUS.
(DNAA BOX): 5'-TPATO(C/A)A-3'. DNAA BINDS TO ATP AND TO
ACIDIC PHOSPHOLIPIDS (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SIMILARITY: BELONGS TO THE DNAA FAMILY.
